### **VERY EASY**

#### 1. N-th Tribonacci Number

```
The Tribonacci sequence Tn is defined as follows: T0 = 0, T1 = 1, T2 = 1, and Tn+3 = Tn + Tn+1 + Tn+2 for n \ge 0. Given n, return the value of Tn.
```

```
Example 1: Input: n = 4
```

Output: 4

**Explanation:** 

$$T_3 = 0 + 1 + 1 = 2$$
  
 $T_4 = 1 + 1 + 2 = 4$ 

Example 2: Input: n = 25

Output: 1389537

Constraints:  $0 \le n \le 37$ 

The answer is guaranteed to fit within a 32-bit integer, ie. answer  $\leq 2^31 - 1$ .

#### **CODE:**

```
def tribonacci(n: int) -> int:
    if n == 0:
        return 0
    if n in (1, 2):
        return 1
    dp = [0, 1, 1]
    for i in range(3, n + 1):
        dp.append(dp[i - 1] + dp[i - 2] + dp[i - 3])
    return dp[n]
print(tribonacci(4))
```

```
Output

4
=== Code Execution Successful ===
```

### **Easy**

### 1. Climbing Stairs

You are climbing a staircase. It takes n steps to reach the top. Each time you can either climb 1 or 2 steps. In how many distinct ways can you climb to the top?

```
Example 1: Input: n = 2
                 Explanation: There are two ways to climb to the top.
                 1.1 \text{ step} + 1 \text{ step}
                 2. 2 steps
Constraints:1 <= n <= 45
CODE:
def climbStairs(n: int) -> int:
  if n == 1:
     return 1
  dp = [0] * (n + 1)
  dp[1], dp[2] = 1, 2
  for i in range(3, n + 1):
     dp[i] = dp[i - 1] + dp[i - 2]
  return dp[n]
print(climbStairs(2)) # Output: 2
 Output
2
```

### **Medium:**

# 2.Longest Palindromic Substring

Given a string s, return the longest palindromic substring in s.

Example 1: Input: s = "babad"

=== Code Execution Successful ===

Output: "bab"

Explanation: "aba" is also a valid answer.

Example 2: Input: s = "cbbd"
Output: "bb"

Constraints: 1 <= s.length <= 1000 s consist of only digits and English letters.

#### **CODE:**

```
def longestPalindrome(s: str) -> str:
    def expand_around_center(left, right):
        while left >= 0 and right < len(s) and s[left] == s[right]:
        left -= 1
        right += 1
        return left + 1, right - 1

start, end = 0, 0
for i in range(len(s)):
        11, r1 = expand_around_center(i, i)
        12, r2 = expand_around_center(i, i + 1)
        if r1 - l1 > end - start:
            start, end = l1, r1
        if r2 - l2 > end - start:
            start, end = l2, r2
        return s[start:end + 1]
```

print(longestPalindrome("babad")) # Output: "bab" or "aba"

```
Dutput
bab
=== Code Execution Successful ===
```

#### Hard

# 3. Maximal Rectangle

Given a rows x cols binary matrix filled with 0's and 1's, find the largest rectangle containing only 1's and return its area.

Discover. Learn. Empower.

### Example-

1	0	1	0	0
1	0	1	1	1
1	1	1	1	1
1	0	0	1	0

```
Input:matrix= [["1","0","1","0","0"],["1","0","1","1","1"],["1","1","1","1","1"],
["1","0","0","1","0"]]
```

Output: 6

Explanation: The maximal rectangle is shown in the above picture.

#### **Constraints:**

```
rows == matrix.length
cols == matrix[i].length
1 <= row, cols <= 200
matrix[i][j] is '0' or '1'.
```

#### **CODE:**

```
def maximalRectangle(matrix):
  if not matrix:
    return 0
  def largest histogram area(heights):
     stack = []
    max area = 0
    heights.append(0)
    for i, h in enumerate(heights):
       while stack and heights[stack[-1]] > h:
         height = heights[stack.pop()]
         width = i if not stack else i - stack[-1] - 1
          max area = max(max area, height * width)
       stack.append(i)
    return max area
  cols = len(matrix[0])
  heights = [0] * cols
  max area = 0
  for row in matrix:
     for j in range(cols):
       heights[j] = heights[j] + 1 if row[j] == "1" else 0
    max area = max(max area, largest histogram area(heights))
  return max area
```

Discover. Learn. Empower.

matrix = [["1", "0", "1", "0", "0"], ["1", "0", "1", "1", "1"], ["1", "1", "1", "1", "1"], ["1", "0", "0", "1", "0"]]

print(maximalRectangle(matrix))

```
Output

6
=== Code Execution Successful ===
```

## Very Hard

### 4. Cherry Pickup

You are given an n x n grid representing a field of cherries, each cell is one of three possible integers.

0 means the cell is empty, so you can pass through,

1 means the cell contains a cherry that you can pick up and pass through, or

-1 means the cell contains a thorn that blocks your way.

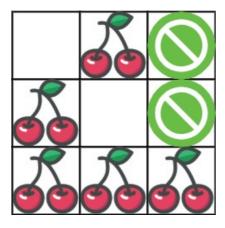

Return the maximum number of cherries you can collect by following the rules below:

Starting at the position (0, 0) and reaching (n - 1, n - 1) by moving right or down through valid path cells (cells with value 0 or 1).

After reaching (n - 1, n - 1), returning to (0, 0) by moving left or up through valid path cells.

When passing through a path cell containing a cherry, you pick it up, and the cell becomes an empty cell 0.

If there is no valid path between (0, 0) and (n - 1, n - 1), then no cherries can be collected.

Input: grid = [[0,1,-1],[1,0,-1],[1,1,1]]

**Output: 5** 

Explanation: The player started at (0,0) and went down, down, right right to reach (2,2).

4 cherries were picked up during this single trip, and the matrix becomes [[0,1,-1],[0,0,-1],[0,0,0]].

Then, the player went left, up, up, left to return home, picking up one more cherry. The total number of cherries picked up is 5, and this is the maximum possible.

```
Example 2: Input: grid = [[1,1,-1],[1,-1,1],[-1,1,1]]
Output: 0
Constraints:
n == grid.length
n == grid[i].length
1 \le n \le 50
grid[i][j] is -1, 0, or 1.
grid[0][0] != -1
grid[n-1][n-1]!=-1
CODE:
def cherryPickup(grid):
  n = len(grid)
  dp = [[[float('-inf')] * n for _ in range(n)] for _ in range(n)]
  dp[0][0][0] = grid[0][0]
  for r1 in range(n):
     for c1 in range(n):
       for c2 in range(n):
          r2 = r1 + c1 - c2
          if 0 \le r2 \le n and grid[r1][c1] != -1 and grid[r2][c2] != -1:
             cherries = grid[r1][c1]
             if c1 != c2:
               cherries += grid[r2][c2]
             prev = max(
               dp[r1 - 1][c1][c2] if r1 > 0 else float('-inf'),
               dp[r1][c1 - 1][c2] if c1 > 0 else float('-inf'),
               dp[r1 - 1][c1][c2 - 1] if r1 > 0 and c2 > 0 else float('-inf'),
               dp[r1][c1 - 1][c2 - 1] if c1 > 0 and c2 > 0 else float('-inf'),
             dp[r1][c1][c2] = prev + cherries if prev != float('-inf') else float('-inf')
  return max(0, dp[n - 1][n - 1][n - 1])
grid = [[0, 1, -1], [1, 0, -1], [1, 1, 1]]
print(cherryPickup(grid))
```

# Output

0

=== Code Execution Successful ===
